

Data Consolidation and Reporting Application

Data Consolidation and Reporting Application

The Application is built for one of the largest financial institutions in West Africa, and supports a large and complex portfolio.

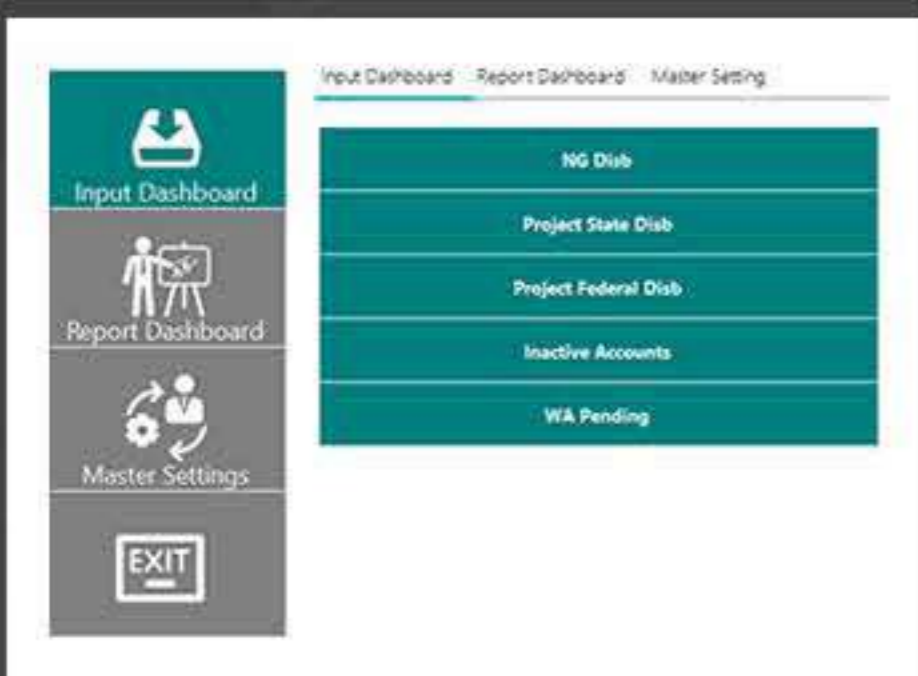

Challenge

Our Client required a system for extracting data from multiple sources, consolidating it and generating multiple complex graphical reports for the portfolio performance broken down into sectors, states and a lot of other parameters.

Key Features

AAPNA team studied the various data sources, and build a unified data structure to support the various data points. Our solution included the following features and has shrunk the manual work of weeks to near Zero.

Data Extraction Module for extracting data from different sources.

Data Consolidation Module for consolidating the extracted data.

Report Module generates reports in excel and graphs representing complex data.

The tool serves as a powerful presentation platform, used by the head of the organization to present progress to various state heads.

Technology Used

The entire application is developed in Microsoft .NET Framework.
